

Dosimetry Tools for Field Studies

Tom Hinton, David Broggio, Francois Trompier (IRSN, France)

James Beasley Savannah River Ecology Laboratory, USA

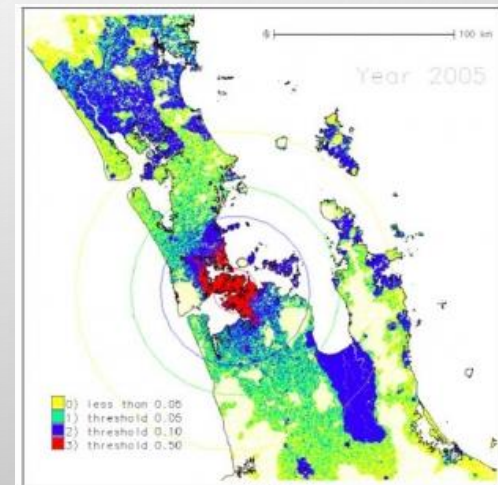

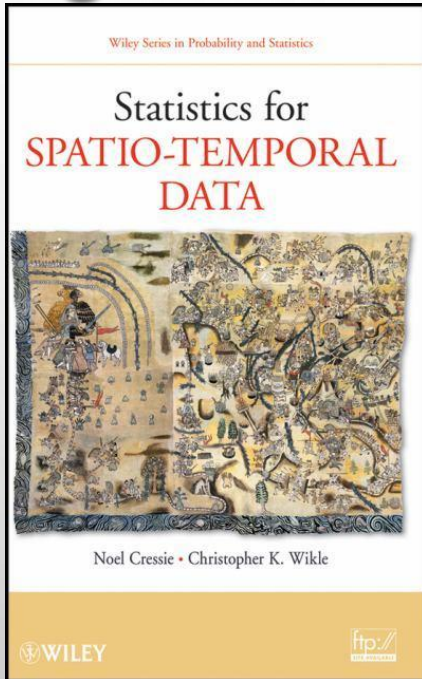

Dosimetry Tools

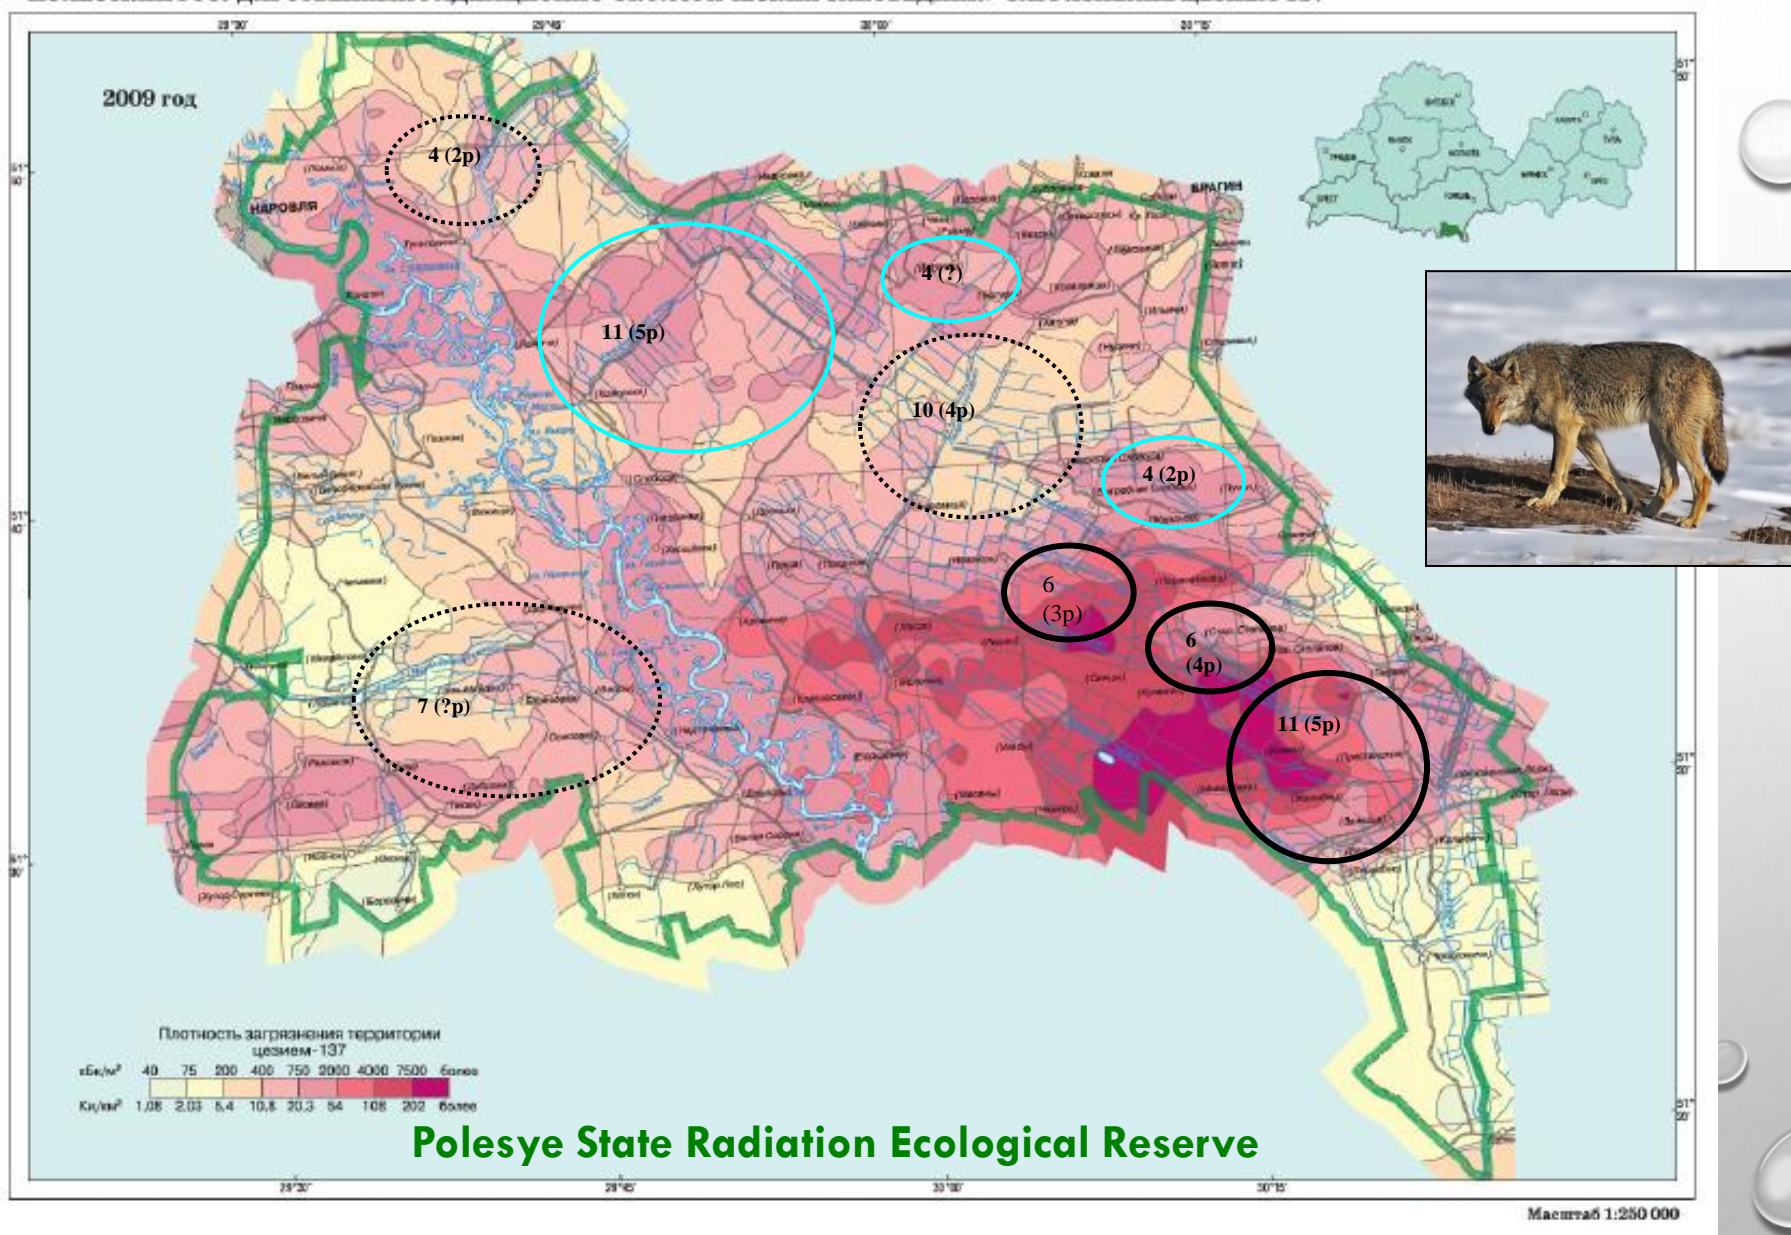

- Passive TLDs
- Electronic TLDs
- Reciprocal Translocations of Chromosomes
- Electronic Paramagnetic Resonance
- Whole-body Assay
- Voxel Phantoms
- GPS-Dosimeter

Accurate quantification of absorbed dose is among the greatest challenges in field research of free-ranging animals, and it is the measurement most lacking in many of the controversial papers regarding radiation effects to wildlife at Chernobyl

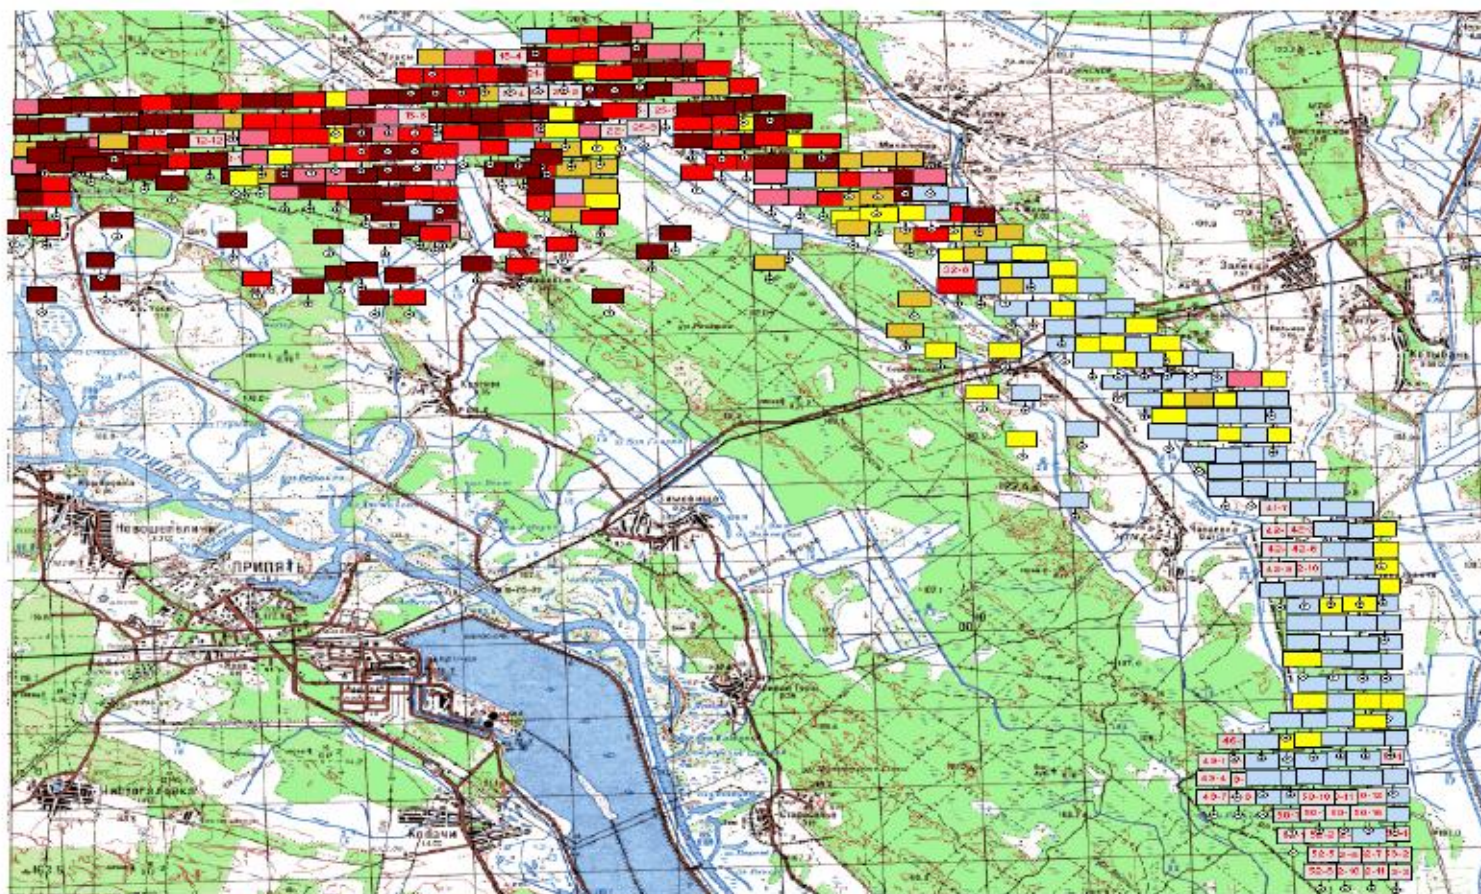

Current wildlife dose models, and associated field measurements, do not assess wildlife exposure realistically because they do not consider the spatial and temporal variability in habitat use, or the large heterogeneity in levels of contamination

2160 km2

20 100 200 300 400 600 1000 kBq/m²

Selection is impossible

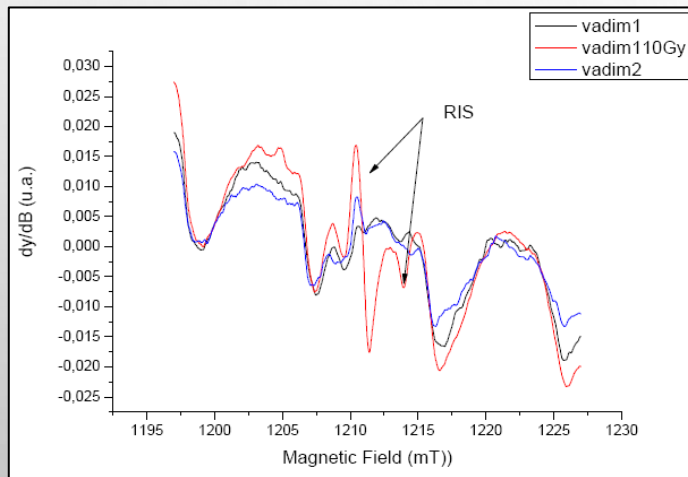

Figure 1.4 - Density of soil pollution ⁹⁰Sr on a site № 1

(from Brown et al. 2012)

Two methods for estimating an animal's life time dose

Electronic Paramagnetic Resonance (EPR) of tooth enamel

Francois Trompier, IRSN

EPR spectra in Q-band of two wolf teeth samples (5 mg).
Sample Vadim-1 was irradiated at 10 Gy to identify the RIS

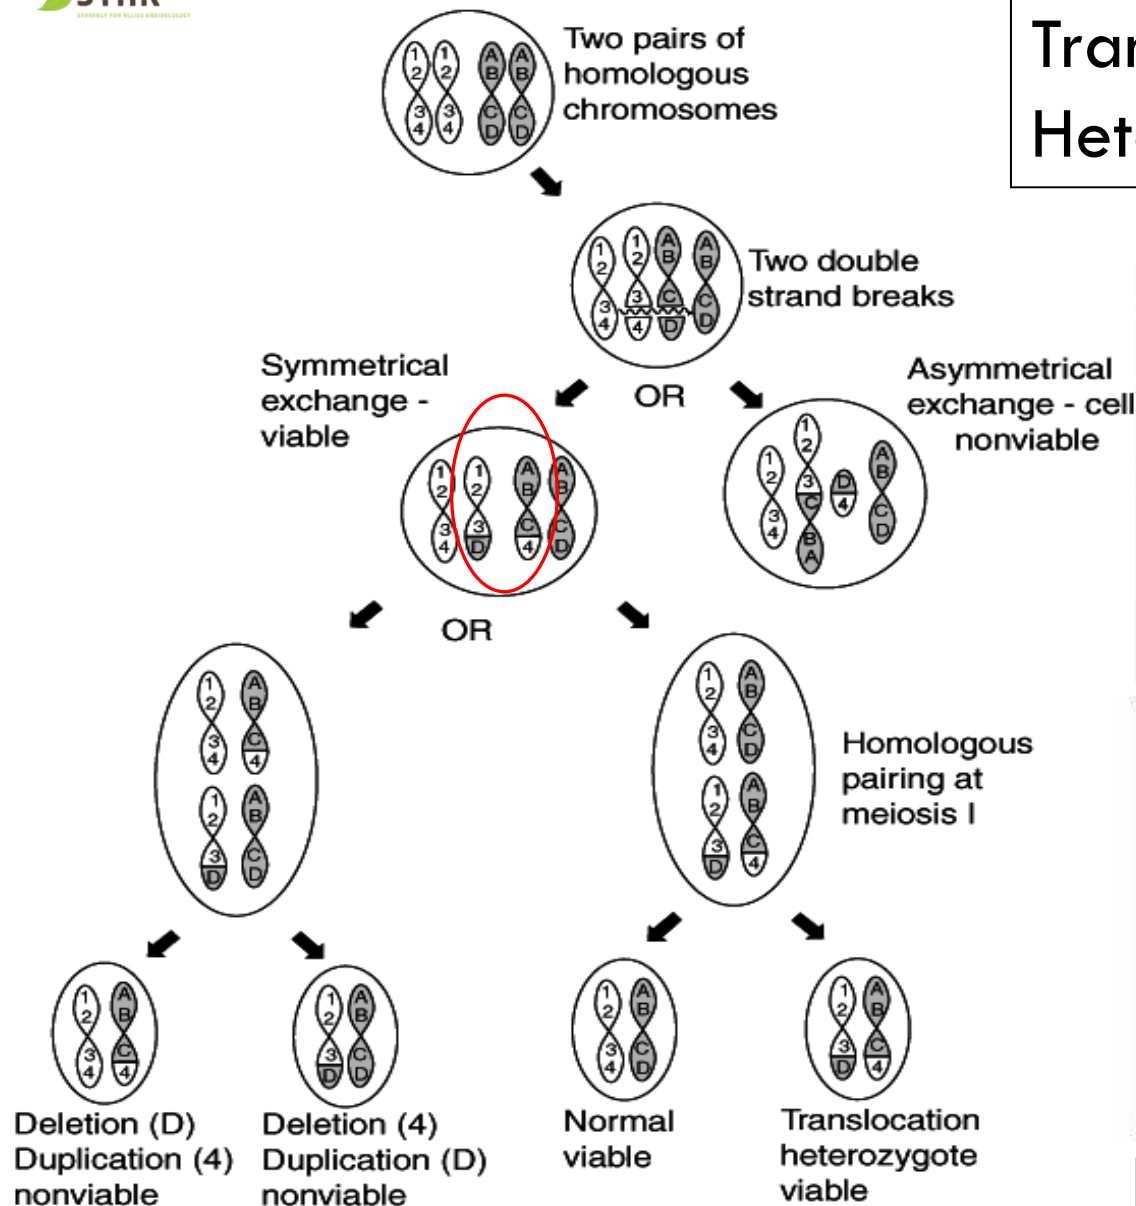

Reciprocal Translocations

- An indication of an organisms integrated life-time dose
- Not lethal to cell
- Frequencies of RTs accumulate with dose
- Result in relocation of chromosome sections

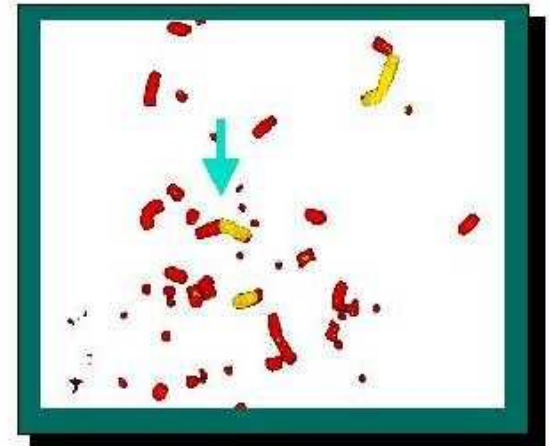

Ulsh et al. 2003. Environmental biodosimetry: a biologically relevant tool for ecological risk assessment and biomonitoring. JER 66:121-139.

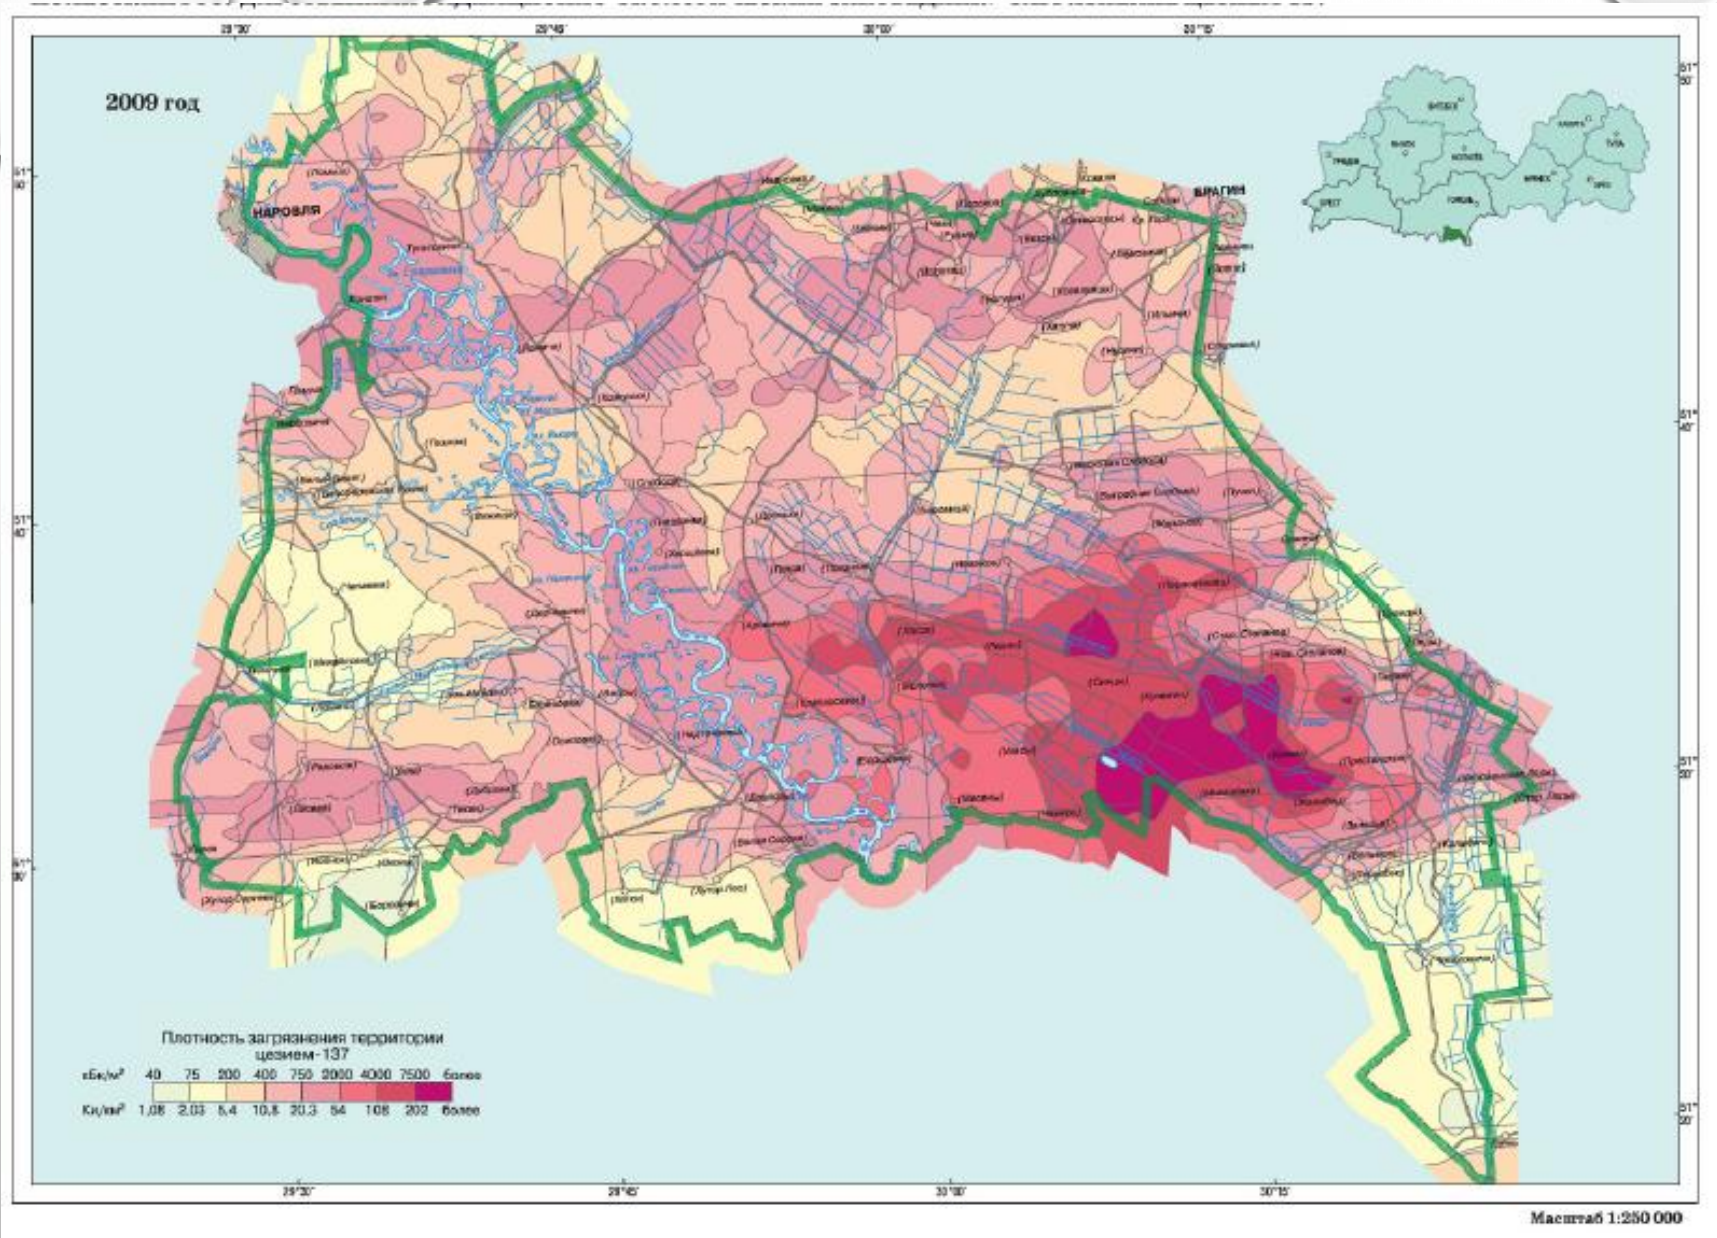

Translocation Heterozygosity

50 % reduction
in reproductive
success

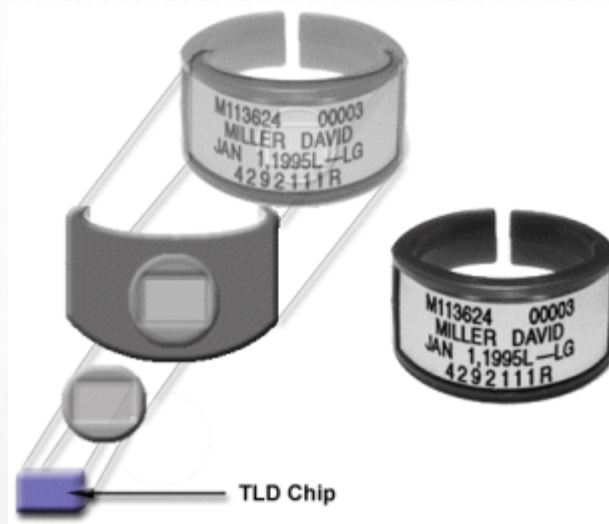

Polesye State Radiation Ecological Reserve

2160 km²

Thermoluminescent Dosimeters (TLDs)...

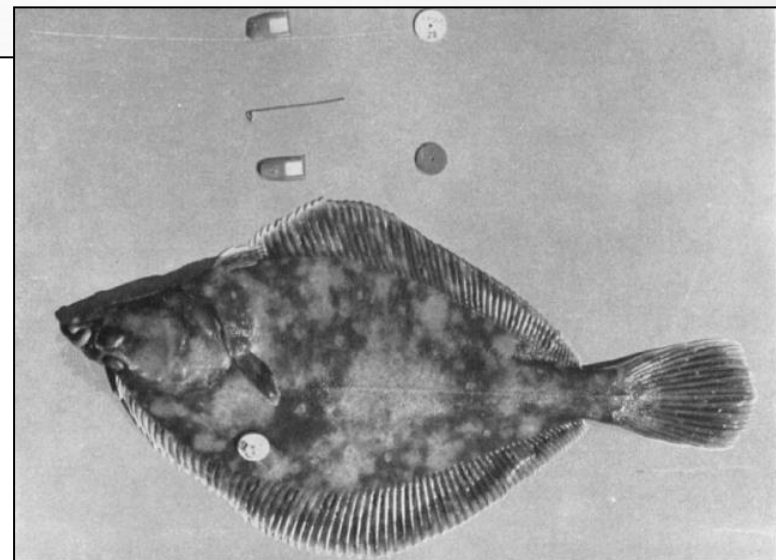

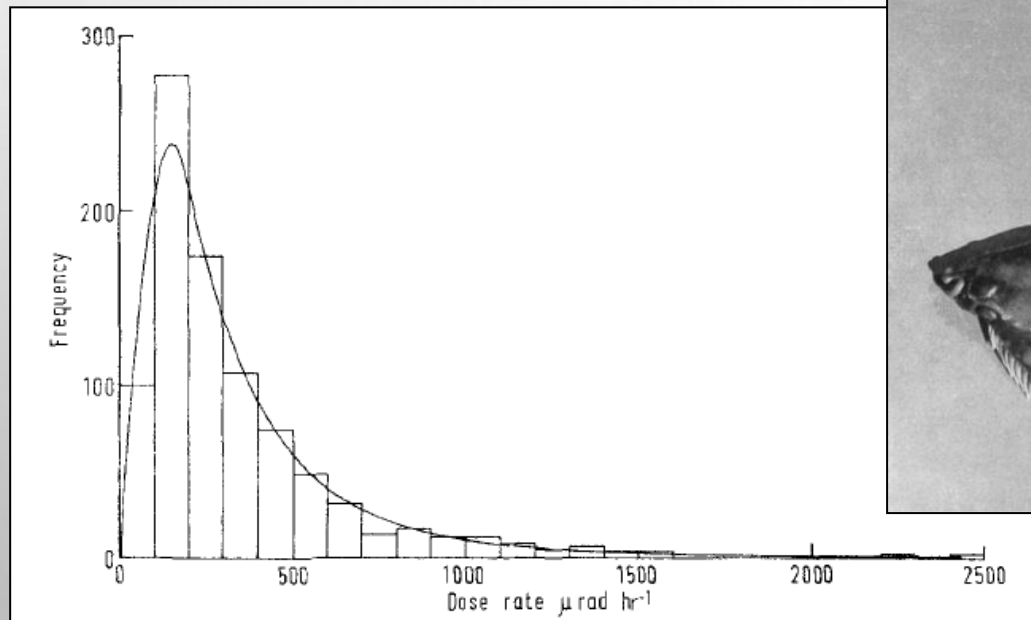

THE RADIATION DOSE RECEIVED BY PLAICE (*PLEURO-NECTES PLATESSA*) FROM THE WASTE DISCHARGED INTO THE NORTH-EAST IRISH SEA FROM THE FUEL REPROCESSING PLANT AT WINDSCALE

D. S. WOODHEAD

Ministry of Agriculture, Fisheries and Food, Fisheries Radiobiological Laboratory,
Hamilton Dock, Lowestoft, Suffolk, England

(Received 17 July 1972; in revised form 3 January 1973)

3580 fish captured, tagged and released; 29% recaptured

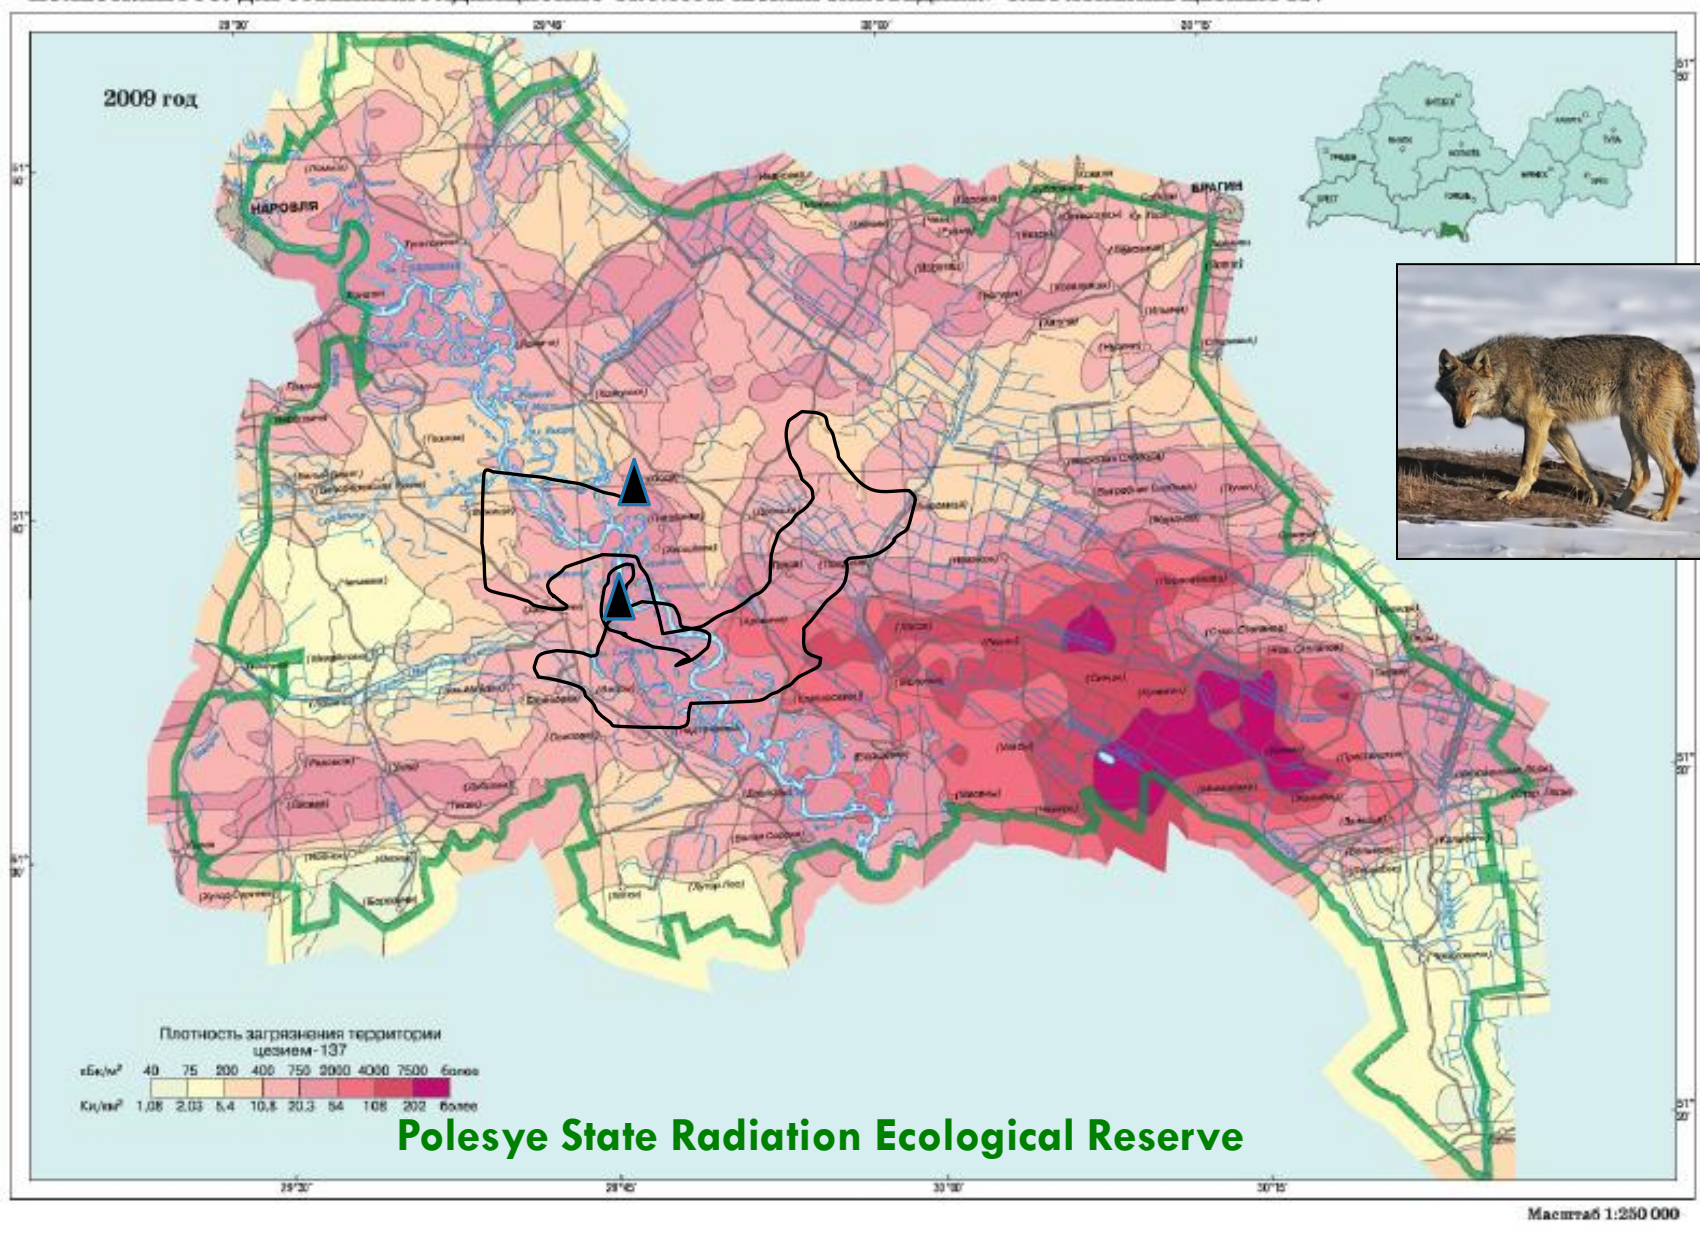

Satellite

Wildlife GPS collars with global,
2-way, satellite communication to user

With programmed release of the
collar ... so that it disconnects from
the animal

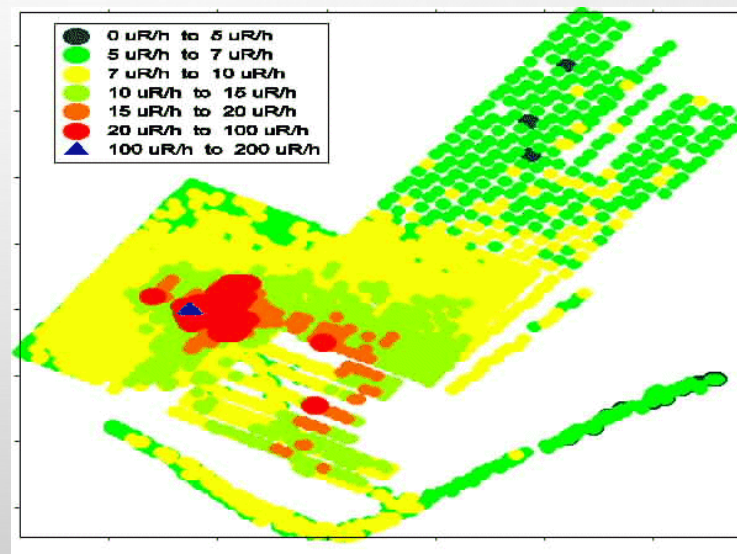

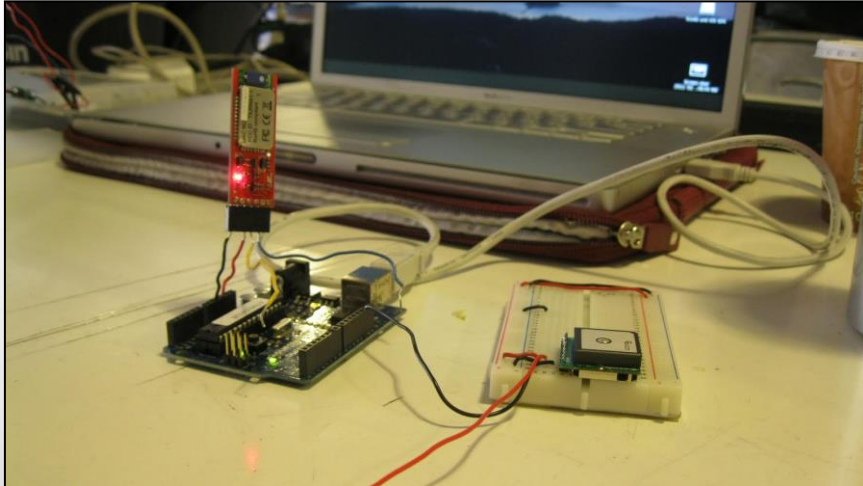

Electronic Dosimeter

GPS-electronic dosimeter combinations already exist in situations where size of the units, battery life, and environmental conditions are not factors

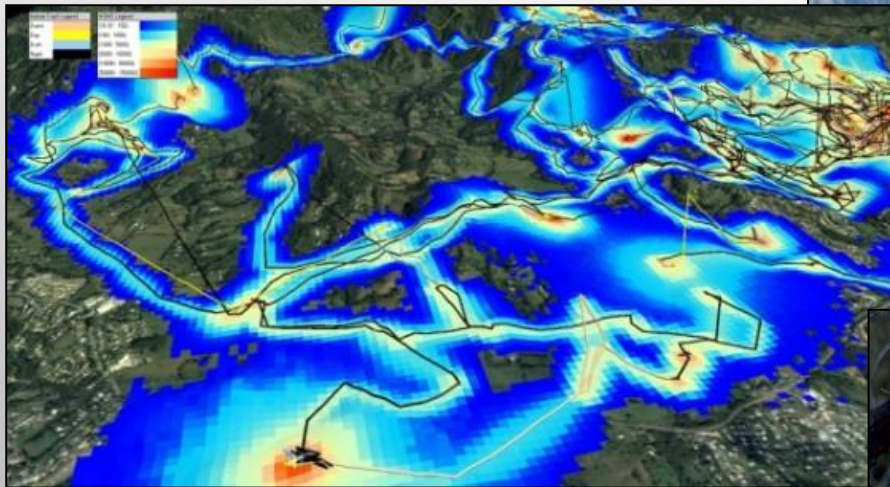

The challenge of our research was to: 1) miniaturize the components so that they can be attached to an animal; 2) ensure that the two units communicate properly with each other; 3) have sufficient battery life; and 4)... withstand very harsh environmental conditions.

We have produced **a new scientific tool** that permits an animal's location and short-term integrated dose to be periodically sent, via satellite, to the investigator.

Test results of three GPS-dosimeter units identically exposed within a ^{60}Co calibration facility.

Photo 1: Black GPS-Dosimetry Collar on Calibration Stand

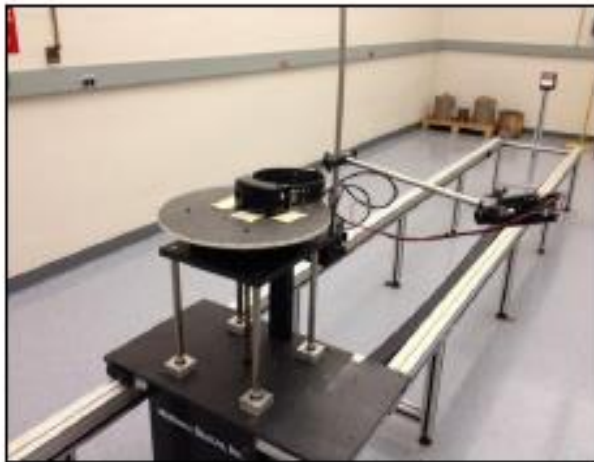

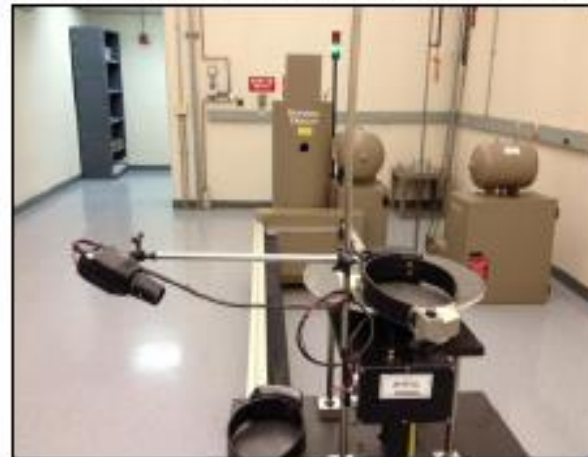

Photo 2: GPS-Dosimetry Collar on Calibration Stand, facing the Gamma Source (under yellow square at far end of the room)

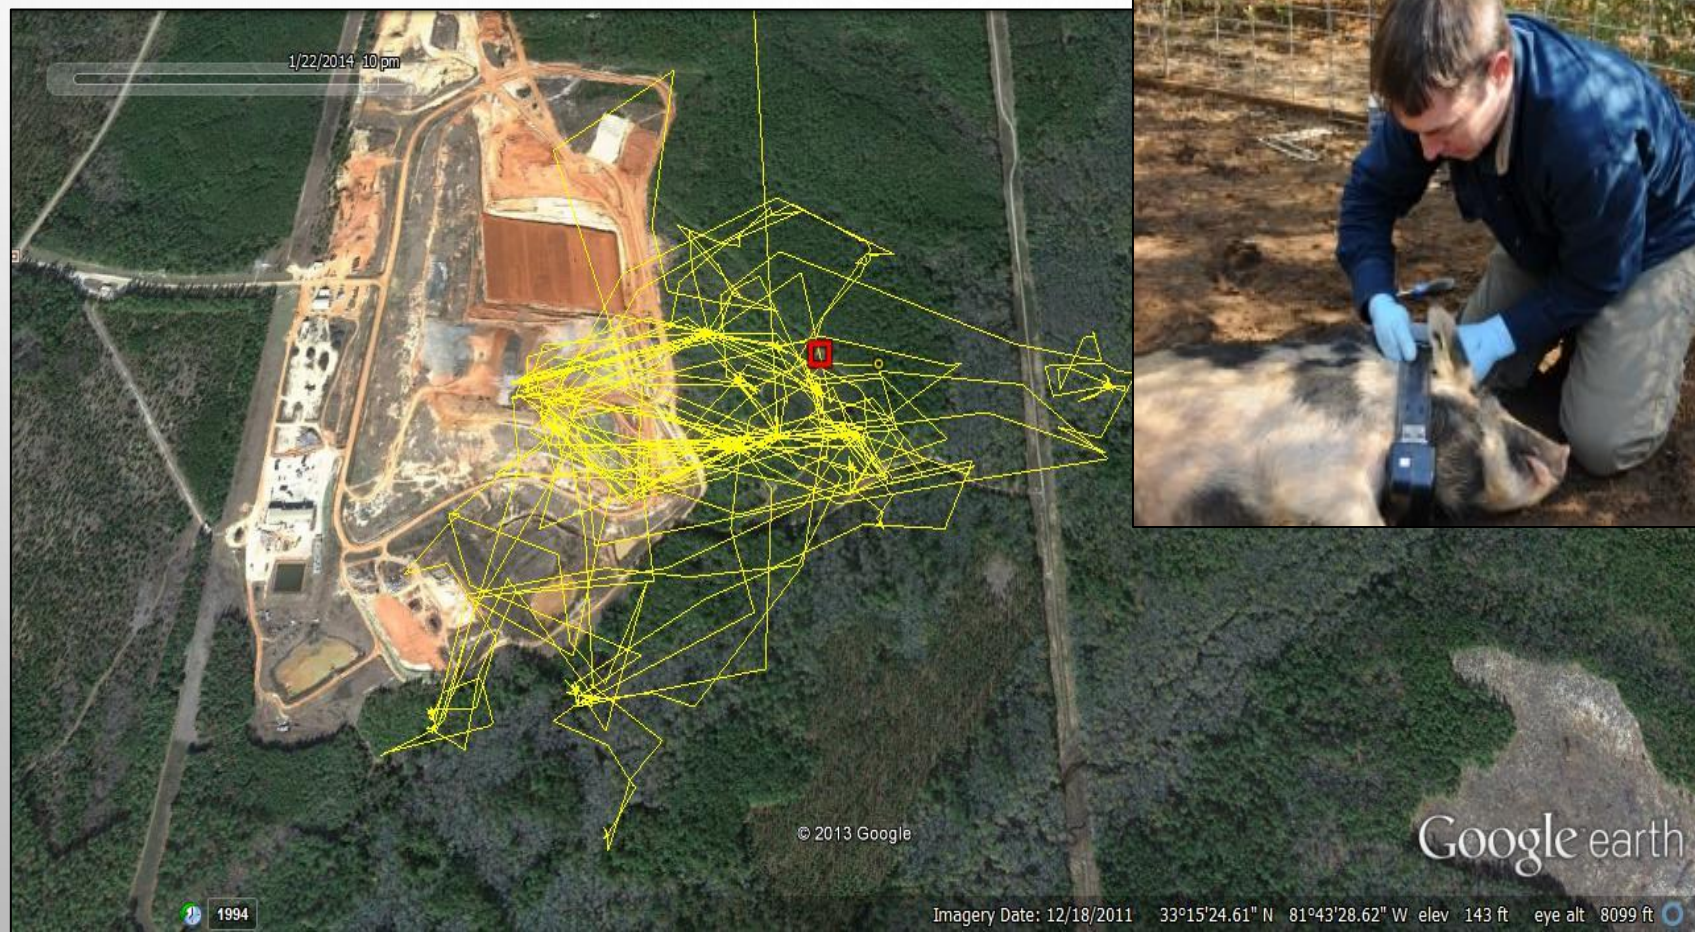

Results:

Test Exposure	collar 13650		collar 13651		collar 13652		Mean of 3	Std Dev.	CV	2 Std. Dev.	Mean -2 Std. Dev.	Mean + 2 Std. Dev.
	Integrated Dose (uSv)	Measured uSv	Integrated Dose (uSv)	Measured uSv	Integrated Dose (uSv)	Measured uSv						
pre-test reading on dosimeter	134		135		159							
reading after 10 uSv	146	12	147	12	170	11	11.7	0.6	4.9	1.2	10.5	12.8
pre-test reading on dosimeter	147		147		170							
reading after 25 uSv	175	28	176	29	202	32	29.7	2.1	7.0	4.2	25.5	33.8
pre-test reading on dosimeter	175		176		202							
reading after 50 uSv	232	57	232	56	259	57	56.7	0.6	1.0	1.2	55.5	57.8
pre-test reading on dosimeter	233		232		259							
reading after 5 uSv	238	5	238	6	266	7	6.0	1.0	16.7	2.0	4.0	8.0

Comparison of GPS-Dosimeter readings

Deployed for 45 days on three hogs from the same sounder

Days Elapsed	Collar 13650				Collar 13651				Collar 13652			
	Date	Time	uGy	Dose	Date	Time	uGy	Dose	Date	Time	uGy	Dose
	1/6/2014	17:00	298	<u>received</u>	1/6/2014	17:00	284	<u>received</u>	1/6/2014	17:00	314	<u>received</u>
45	2/20/2014	16:00	384	86	2/20/2014	16:00	365	81	2/20/2014	16:00	398	84

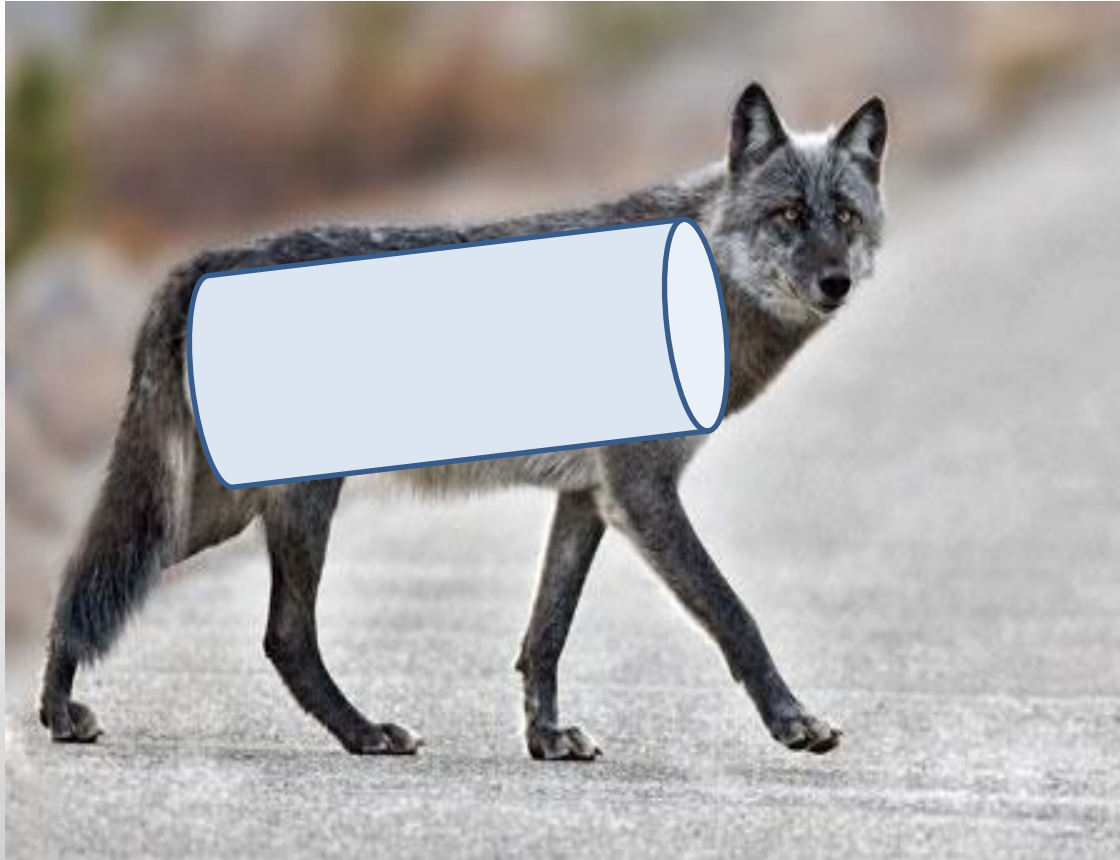

Calibration and Interpretation of Field Dosimetry ??

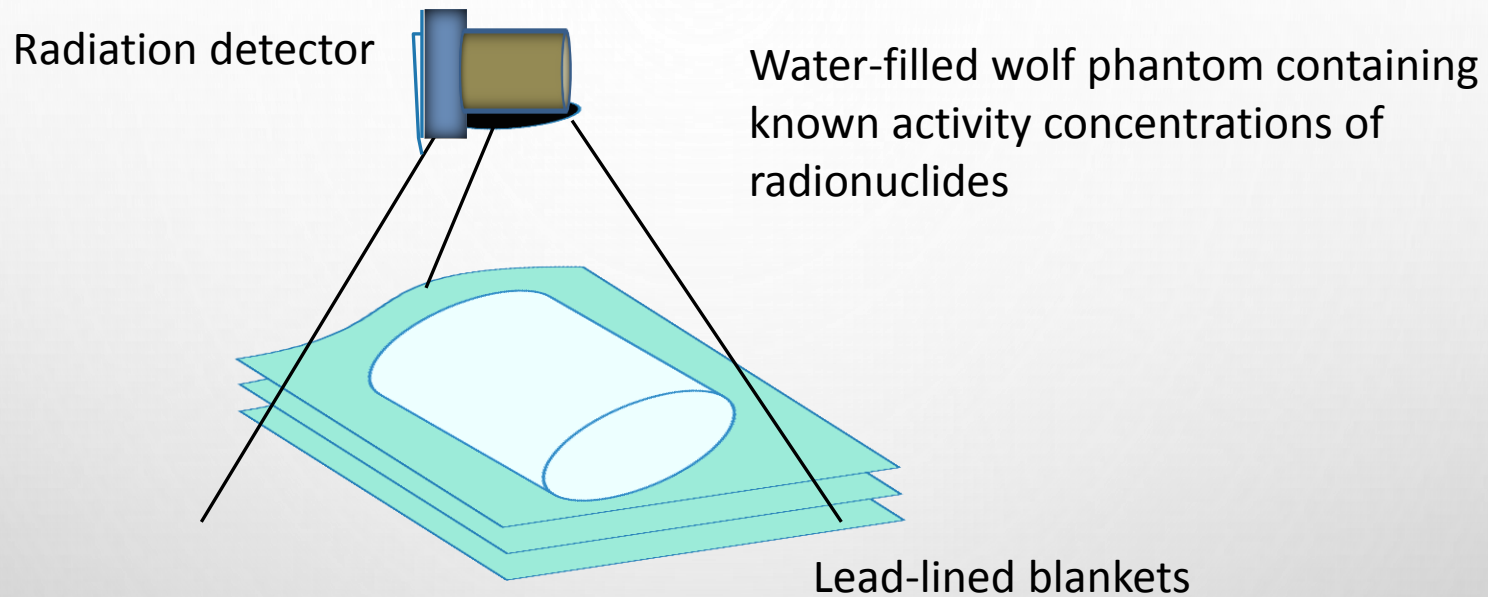

Whole-body counting humans for radiation

Cylinders for calibration phantoms

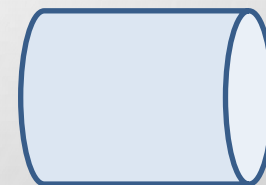

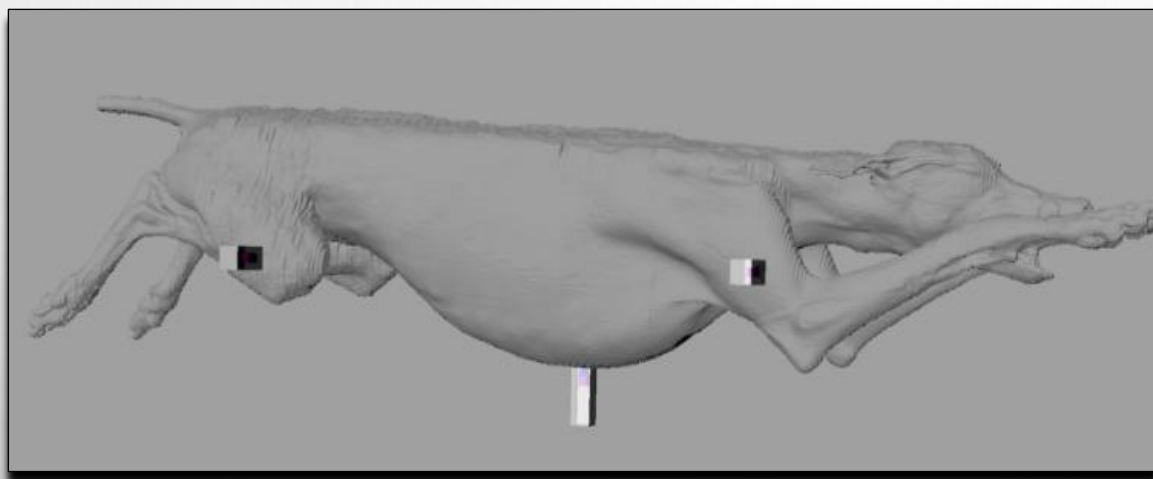

Wolf represented by cylinders filled with calibrated liquids

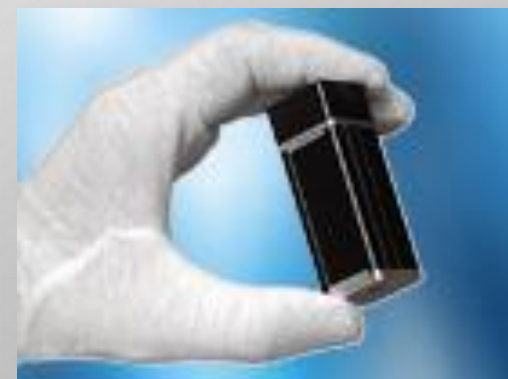

Dr. David Broggio, IRSN, adapted a voxel phantom of a large dog, produced by a Canadian research team, to the physical dimensions of a wolf using Rhinoceros3D modelling software.

G.H Kramer *et al.* *The HML's new voxel phantoms: two human males, one human female, and two male canines.* Health Phys. 103(6):802-807 (2012).

silicon detector of Cd, Zn and Te composition

Used a rough model of the CZT detector and Monte Carlo calculations to:

- calculate counting efficiencies (*i.e.* calibration factors) for ^{137}Cs ;
- study the dependency of counting efficiencies as a function of counting positions and wolf weight;
- deduce the expected counting rate and counting time needed to obtain a reliable statistics;
- design a calibration phantom;
- discuss a preliminary design of a collimator.

The GPS-Dosimeter Tool will help make other related research possible

understand the sub-lethal effects of chronic, low-dose exposures

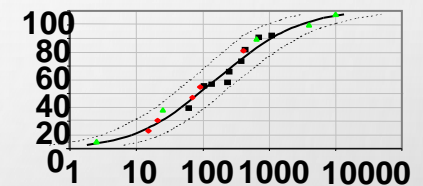

determine the effects from multi-generational exposures

develop environmental benchmarks, below which risks are acceptable

develop bioindicators of radiation exposure

reduce uncertainties in wildlife dose models
