

Petrov M.F. Fallows of the Chernobyl Exclusion Zone// Bulletin of Ecological State of Exclusion Zone of Absolute (Mandatory) Resettlement.- 2008.- 2 (32). P.18-25.

Biologic component and cyclic changes to hydrothermal conditions are main factors in a long phased self-recovery of natural-territorial fallows complexes. Types of fallows and their species of flora are described. Due to extremely large areas of current fallows the impact of animal inhabitants is particularly noticeable. Forming edaphically determined stable vegetation is possible only through restoring the hydrological soil conditions, previously changed by man, by zoological component.
