

Veselskiy N.F. Monitoring the common crane in the conditions of Polissya nature reserve (historical aspect)// Monitoring and protection of biodiversity in Ukraine: Animal world / Series: "Conservation Biology in Ukraine". – Ed.. 16, Vol. 2. Kyiv; Chernivtsi: Print Art, 2020. – P. 25-29.

The common crane (*Grus grus* Linnaeus, 1758), as a typical representative of the ecosystems of Central Polissya, can serve as a biological indicator of the state of wetlands and forests. The literature data on the finds of this species are presented. Long-term monitoring of the common crane in the Polissya Nature Reserve indicates the suitable conditions for the existence of this species in the territories of the nature reserve fund.
